Lab 17

Lily Huynh (PID: A16929651)

2025-03-04

Table of contents

Downstream analysis	1
Principal Component Analysis	2
OPTIONAL: Differential expression analysis	6

Downstream analysis

```
library(tximport)

# setup the folder and filenames to read
folders <- dir(pattern="SRR21568*")
samples <- sub("_quant", "", folders)
files <- file.path( folders, "abundance.h5" )
names(files) <- samples

txi.kallisto <- tximport(files, type = "kallisto", txOut = TRUE)</pre>
```

1 2 3 4

Then I will view the counts of txi.kallisto using head()

```
head(txi.kallisto$counts)
```

	SRR2156848	SRR2156849	SRR2156850	SRR2156851
ENST00000539570	0	0	0.00000	0
ENST00000576455	0	0	2.62037	0

ENST00000510508	0	0	0.00000	0
ENST00000474471	0	1	1.00000	0
ENST00000381700	0	0	0.00000	0
ENST00000445946	0	0	0.00000	0

I will use colSums to see how many transcripts we have for each sample:

```
colSums(txi.kallisto$counts)
```

SRR2156848 SRR2156849 SRR2156850 SRR2156851 2563611 2600800 2372309 2111474

```
sum(rowSums(txi.kallisto$counts)>0)
```

[1] 94561

Then I will filter out any transcript that has no reads and no change.

```
to.keep <- rowSums(txi.kallisto$counts) > 0
kset.nonzero <- txi.kallisto$counts[to.keep,]</pre>
```

```
keep2 <- apply(kset.nonzero,1,sd)>0
x <- kset.nonzero[keep2,]</pre>
```

Principal Component Analysis

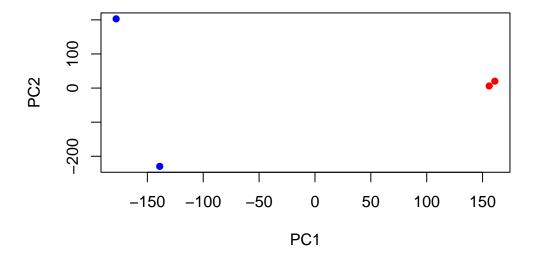

```
pca <- prcomp(t(x), scale=TRUE)</pre>
```

```
summary(pca)
```

Importance of components:

```
PC1 PC2 PC3 PC4
Standard deviation 183.6379 177.3605 171.3020 1e+00
Proportion of Variance 0.3568 0.3328 0.3104 1e-05
Cumulative Proportion 0.3568 0.6895 1.0000 1e+00
```

Create a graph plotting PC1 and PC2:

Q. Use ggplot to make a similar figure of PC1 vs PC2 and a seperate figure PC1 vs PC3 and PC2 vs PC3.

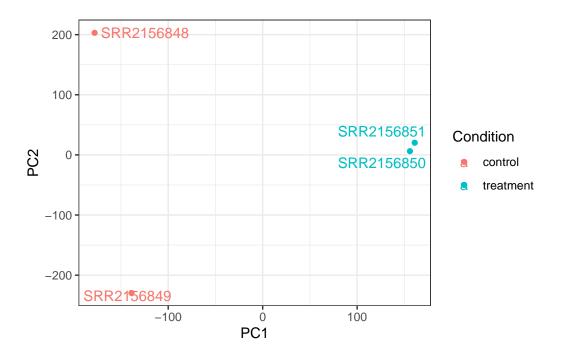

```
library(ggrepel)

# Make metadata object for the samples
colData <- data.frame(condition = factor(rep(c("control", "treatment"), each = 2)))
rownames(colData) <- colnames(txi.kallisto$counts)

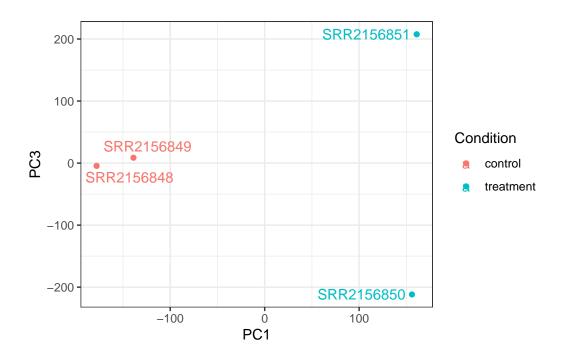

# Make the data.frame for ggplot
y <- as.data.frame(pca$x)
y$Condition <- as.factor(colData$condition)

## ggplot for PC1 and PC2
ggplot(y) +
aes(PC1, PC2, col=Condition) +
geom_point() +</pre>
```

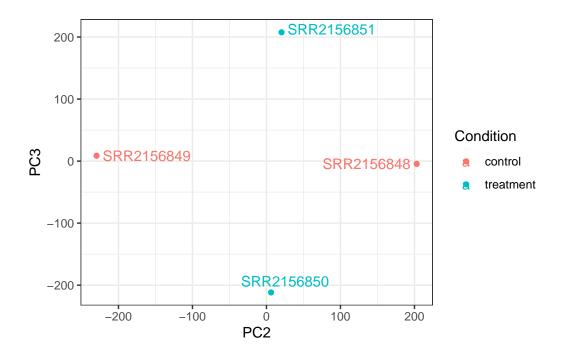

```
geom_text_repel(label=rownames(y)) +
theme_bw()
```

```
## ggpplot for PC1 and PC 3
ggplot(y) +
  aes(PC1, PC3, col=Condition) +
  geom_point() +
  geom_text_repel(label=rownames(y)) +
  theme_bw()
```

```
## ggplot for PC2 vs PC3
ggplot(y) +
  aes(PC2, PC3, col=Condition) +
  geom_point() +
  geom_text_repel(label=rownames(y)) +
  theme_bw()
```

OPTIONAL: Differential expression analysis
